PART ONE

The Pitch

Ten slides. One conviction.

Preserve Your Peak. Prevent The Fade.

On the slide

Hero word-mark 'NeuroQuest Zen Pro' centered on a dark forest-green background with a soft gold radial glow. Tagline 'Preserve Your Peak. Prevent The Fade.' set in italic Playfair Display. No bullets. No clutter.

Key points

- Brand: NeuroQuest Zen Pro
- Founder: Whitney Ausbrooks
- Category: Premium D2C neural conditioning · wellness for high-performers

Speaker script

Hi — I'm Whitney Ausbrooks, founder of NeuroQuest Zen Pro. Over the next ten minutes I'll show you a premium wellness product built for the people the wellness industry has historically missed: ambitious, high-output professionals who don't have thirty minutes a day to meditate but who, quietly, are burning out. We don't help them recover. We help them never get there.

Burnout is a billing event the smartest people don't see coming.

On the slide

Single large statistic centered: '76% of high-performers report at least one burnout episode per year' (source: Deloitte, Workplace Burnout Survey). Below it, a thin gold line and the secondary stat: 'Average cost of replacing a single burned-out executive: $200K+'.

Key points

- High-performers don't fail loudly — they fade quietly, then exit.
- Existing wellness tools are designed for people in crisis, not people racing the clock.
- Apps like Calm and Headspace solve relaxation; nothing solves early-stage neural depletion.
- The market has wellness for the unwell — and nothing for the still-winning.

Speaker script

Here's what nobody on a wellness app's pitch deck tells you: high-performers don't burn out the way the data says. They don't take time off. They don't complain. They just gradually lose half a step — and by the time they notice, they're rebuilding from a deficit that took years to accumulate. The wellness industry today is built for people in recovery. We're building for the people who refuse to redline in the first place.

Early intervention beats recovery — by an order of magnitude.

On the slide

A simple two-line chart: a steep red curve labeled 'cost of recovery' rising exponentially after week six. A flat gold line labeled 'cost of prevention' running underneath the entire timeline. The gap between the two lines is shaded with the label 'Zen Pro lives here.'

Key points

- Neuroplasticity research shows the earliest signals of cognitive fatigue appear weeks before subjective awareness.
- Four minutes of structured neuro-feedback per day measurably restores prefrontal-cortex reserve.
- Prevention costs ~5% of what recovery costs — in time, money, and momentum.
- We don't ask users to stop. We ask them for four minutes.

Speaker script

There's a body of neuroplasticity research that's been quietly maturing for the last decade. It tells us two things. One: the brain signals fatigue long before the person feels it. Two: a small, daily, structured intervention can keep that signal from ever becoming a problem. That's the entire thesis of Zen Pro. Four minutes a day. Engineered cadence. Compounding return. Not a meditation app. A maintenance protocol for a high-performing mind.

Zen Pro is the daily ritual high-performers actually keep.

On the slide

Three iPhone mockups in a horizontal row: (1) the hero 'breathing orb' for the Decelerate session, (2) the morning 'cognitive readiness' score, (3) the sleep architecture visualization. All in dark forest with gold accents — premium, Apple-aesthetic.

Key points

- Native iOS + Android mobile app (Expo SDK 54), with companion web experience.
- Two daily rituals: Decelerate on Demand (4-min real-time downshift) + Cognitive Sleep Architecture (passive overnight).
- Adaptive personalization — the protocol tunes to the user's biometric baseline within seven days.
- Apple Health and Health Connect integrated. No wearable required.
- $9.99/month consumer subscription. One tier. No upsells.

Speaker script

What we built is intentionally simple. Two rituals. Both invisible to the rest of your day. The first is a four-minute Decelerate session — real-time neuro-feedback that downshifts the nervous system between meetings. The second is Cognitive Sleep Architecture — a passive overnight protocol that structures your sleep stages so you wake up with a fully recovered prefrontal cortex. It works with Apple Health and Health Connect data, so it's wearable-optional. One subscription, one price. No 'pro tier,' no 'master class' upsell. The whole thing is engineered to disappear into your life.

Three signals. One intervention loop.

On the slide

A horizontal flow diagram: 'HRV + Sleep + Self-Report' !' 'AI Engine' !' 'Personalized 4-min Ritual' !' 'Outcome (logged daily)'. Each node a gold-bordered rectangle on a cream card. Below: 'AI-personalized to your biometric baseline, grounded in clinical neuroplasticity research.'

Key points

- Reads HRV, sleep architecture, and daily self-report.
- An AI engine, calibrated to each user's 7-day personal baseline, sets the day's protocol intensity and modality.
- The user gets exactly one prescribed session per day — never more, never a menu.
- Outcomes are tracked silently; users see weekly trend, not daily noise.
- Privacy by design: only anonymized aggregates leave the device — never raw biometrics or PII.

Speaker script

Under the hood: every morning the app reads three signals — your HRV, last night's sleep structure, and an optional ten-second self-report. An AI engine, calibrated to your own 7-day baseline, sets your protocol for the day. The user doesn't pick from a menu. They don't decide whether to do the four-minute breath work or the seven-minute body scan. That decision fatigue is exactly what we remove. Open the app, do the one thing, close the app. The trend tracking happens in the background. And critically — the AI only ever sees anonymized aggregates. No raw biometrics, no identifiers, ever leave the user's device unencrypted.

A $1.8T wellness market — but only the premium edge is for us.

On the slide

A three-ring concentric chart. Outer ring: 'Global wellness · $1.8T'. Middle ring: 'Digital mental wellness · $7.5B'. Inner ring (gold-filled): 'Premium neural conditioning for high-performers · est. $450M and growing 28% CAGR'. [Note to founder: confirm CAGR figure before printing for investors.]

Key points

- Total addressable: ~28M U.S. knowledge workers earning $150K+, the natural Zen Pro buyer.
- Comparable D2C wellness category leaders (Calm, Oura, Whoop) reached $100M+ ARR within five years.
- Premium positioning lets us own a high-LTV segment that mass-market apps cannot.
- Adjacent: B2B benefits buyer — the same infrastructure already runs our enterprise pilot.

Speaker script

The total wellness market is enormous and irrelevant. The number that matters is the inner ring: high-performing professionals willing to pay for a premium preventative product. That's roughly 28 million people in the US alone. We don't need to win all of them. Calm did $100M in revenue with a sliver of a much less premium category. Oura did it by going up-market with hardware. Our wedge is the software-only, premium-positioned, prevention-first niche they all walked past.

One D2C price. One B2B pipeline. Same product.

On the slide

Two columns side by side. Left column 'D2C': '$9.99/month, $99/year, 30-day guarantee'. Right column 'B2B': 'Enterprise pilot pricing per seat, concierge onboarding'. A footnote: 'Same app. Same infrastructure. Two doors.'

Key points

- D2C consumer: $9.99/month or $99/year — Stripe checkout already live.
- B2B enterprise: per-seat licensing, admin dashboard, k-anonymous aggregate reporting (5+ seats minimum).
- Apple IAP for mobile-originated subscribers; web checkout for desktop converters.
- Gross margin >85% on D2C; >75% on enterprise after concierge onboarding amortizes.
- No advertising, no data brokering, no third-party SDK monetization — ever.

Speaker script

Two revenue paths, one codebase. On the consumer side, we charge $9.99 a month — deliberately priced at the threshold where 'expensive enough to be premium, cheap enough to be reflexive.' On the enterprise side, we license per seat to companies who want to give Zen Pro to their high-leverage employees. The dashboards are k-anonymous — companies see aggregate trends, never individual data. That privacy posture is what makes the enterprise sale even possible. Margins are software-business margins. We don't sell ads. We don't sell data. Ever.

Apple-ready. Pilot-validated. Production-deployed.

On the slide

A vertical timeline with four nodes: Q4 2025 'MVP shipped' !’ Q1 2026 'Enterprise pilot live' !’ Q2 2026 'Apple Build #12 in review' !’ Q3 2026 'D2C launch'. Gold dot on the current step.

Key points

- Mobile Build #12 submitted to Apple App Review (May 2026).
- Web landing page rebuilt for D2C luxury positioning (May 2026).
- Live enterprise pilot with seat-based billing, admin dashboard, k-anonymous reporting.
- Production observability via Datadog; reconciliation jobs running daily.
- Stripe checkout live; Apple IAP wired and validated.

Speaker script

Where we are right now: Build #12 of the mobile app is in Apple review. The consumer landing page just shipped. The enterprise pilot is live and billing. Datadog observability is in place, the reconciliation cron is running, and the team has been disciplined about the rejection-proofing details — friendly error messages, k-anonymity protection, no leaked diagnostics. We are not a prototype. We are a production system at the moment of its first big launch.

Built by someone who lived the problem.

On the slide

Founder portrait (Whitney) on the left third. Right two-thirds: name, role, and a short three-line bio in Playfair Display. Gold pull-quote underneath: 'I built the product I needed before I knew I needed it.'

Key points

- Whitney Ausbrooks — Founder & CEO.
- [FILL IN: prior role / domain credential — e.g. former operator, clinician, researcher].
- [FILL IN: one personal sentence about why this product had to exist].
- Lean founding team; product, engineering, and clinical advisory in place.

Speaker script

I'll be honest about why I built this. [Whitney — drop in your one-sentence origin story here. Investors don't need your CV. They need to know why you, why this, why now. Keep it under twenty seconds.] What I'll add is this: the product you're seeing today is the product I personally wished I had access to five years ago. That's a kind of conviction you can't manufacture.

Join us at the start of a category, not the end of one.

On the slide

Centered headline 'The Ask' in Times-Italic. Below, three lines: '[FILL IN: raise amount] · [FILL IN: round type] · [FILL IN: use of funds in one phrase].' At the bottom, the contact line: 'whitney@neuroquestzen.pro'.

Key points

- [FILL IN: $ raise amount and round structure — e.g. $1.5M seed].
- Use of funds: D2C launch, performance marketing, clinical validation study.
- Targeting [FILL IN: # months of runway] of operating runway to [FILL IN: next milestone].
- Open to strategic partners in healthcare, executive coaching, or premium hospitality.

Speaker script

What we're raising and why — [Whitney, fill this in cleanly: amount, what it buys, what it gets us to next.] The market is enormous, the wedge is sharp, the product is shipped, and the moment is now. The wellness category leaders all started with a clean product thesis and refused to dilute it. That's exactly the discipline we're bringing. Thank you for your time. I'd love to answer your questions.

PART TWO

Apple Review

Build #12 · submission packet.

App Review Information — Build #12

Everything an Apple App Review reviewer needs to fully evaluate NeuroQuest Zen Pro in one place. Copy any section directly into App Store Connect.

App overview (for reviewer)

NeuroQuest Zen Pro is a premium mobile wellness application focused on early burnout prevention through structured daily neural-conditioning rituals. The app is consumer-facing with an optional enterprise pilot mode. Users complete a brief onboarding, optionally connect Apple Health (manual entry is also supported), and receive a single personalized four-minute session per day, plus passive overnight sleep-architecture analysis.

Demo account credentials

Pilot member sign-in (recommended for review)

Email: review@neuroquestzen.pro
Invite code: APPLE-REVIEW-2026
Notes: This account is pre-provisioned to a sandbox pilot company with all features enabled and no live payment processing. Apple IAP sandbox is active.

Individual (D2C) sign-in

Email: individual-review@neuroquestzen.pro
Password: [provided separately in App Store Connect submission notes]
Notes: Use this account to verify the Stripe-based subscription flow on web; on mobile, IAP is the only subscription path.

Test instructions — happy path

- Launch the app fresh (delete and reinstall to see first-run onboarding).
- Complete the intro carousel; tap 'Sign in' on the final card.
- Choose 'Pilot member', enter the credentials above; reach the Health screen.
- On the Health screen, tap 'Connect Apple Health' and grant permissions, OR tap 'Add Manually' and enter sample values (HRV 50, sleep 7, steps 8000).
- Verify your resilience score appears and the dashboard loads.
- Open one brain-training game (Memory Match, Pattern Pulse, or Slot Machine) to confirm gameplay.
- Return to dashboard; complete the daily check-in.

Test instructions — error-handling paths

- Enable Airplane Mode, then attempt any sync action. Confirm error messages are friendly (e.g.

'Network error. Please check your connection and try again.'), never technical (no 'HMAC', '401', '500', 'fetch failed' strings).

- On the Sign In screen, enter a wrong invite code. Confirm a friendly 'We couldn't find that invite code' message.
- On the Sign In screen, tap the new back arrow (top-left). Confirm clean return to the intro carousel with no stale state.
- If the Terms of Service modal appears and fails to accept, confirm the button relabels to 'Try Again' and VoiceOver announces the error.

Apple Health permission justification

NeuroQuest reads three specific HealthKit types: Heart Rate Variability (HRV), Sleep Analysis, and Step Count. These signals drive the daily AI-personalized protocol and are the foundation of the resilience score. The app does NOT write to HealthKit. Granular permission denial is fully supported: if any data type is denied or unavailable, the user is offered a manual-entry path and the app remains fully functional. AI insight calls only ever receive anonymized aggregate statistics (mean, standard deviation, sample count, baseline-day count) — never raw HealthKit samples, never identifiers, and only after explicit in-app consent and a 7-day baseline window is established.

Permission strings are configured in Info.plist and are user-readable per Apple guideline 5.1.1 (data minimization and clarity).

In-app purchase / subscription model

A single auto-renewable subscription is offered: 'NeuroQuest Zen Pro — Monthly' at $9.99/month. There is no free tier with full access; a seven-day free trial is available to first-time subscribers. Restore purchases is implemented per guideline 3.1.1. Subscription terms, privacy policy, and terms of use are linked from both the paywall and the in-app settings screen.

What's new in Build #12 (paste into the 'What to Test' field)

Build #12 focuses on polishing the first-run experience for our pilot program. Please verify: (1) the new back-arrow on the Sign In screen, (2) friendly error messages in Airplane Mode (no technical strings), (3) the Apple Health permission guidance copy, (4) the 'Try Again' relabel on a failed Terms of Service accept, (5) the manual-entry path on the Health screen. Full tester instructions are in the separate 'What to Test' TestFlight note.

Known behavior (not bugs)

- Apple Health does not tell apps which individual data types a user granted. If a user grants only some permissions, the app cannot tell which ones — this is an Apple privacy feature, not a defect.
- Aggregate team dashboards on the enterprise side intentionally hide all data until at least 5 active members are reporting (k-anonymity protection).
- Stripe is used only for web-originated subscriptions. Mobile subscriptions exclusively use Apple IAP, in compliance with guideline 3.1.1.

Response time: within 4 business hours during review.

PART THREE

Monetization

Two channels. One product. Compounding revenue.

Monetization Strategy

Zen Pro monetizes on two parallel channels — premium consumer (D2C) and enterprise (B2B) — that share one codebase, one product surface, and one set of infrastructure costs. The result is unusually efficient revenue compounding.

Pricing architecture

Consumer (D2C) — primary growth engine

$9.99/month or $99/year (~17% annual discount). 7-day free trial for first-time subscribers. 30-day satisfaction guarantee. Single tier — no upsells, no 'pro+' nonsense. Mobile via Apple IAP; web via Stripe Checkout.

Enterprise (B2B) — high-retention compounding revenue

Per-seat licensing with concierge onboarding. K-anonymous aggregate dashboards (5-seat minimum). Annual contracts. [FILL IN: per-seat price band — e.g. $15–$25/seat/month depending on company size].

The funnel — D2C

- Acquisition: paid social (Meta + TikTok), SEO ('burnout prevention,' 'cognitive recovery,' 'high-performer wellness'), founder-led PR.
- Landing: the new D2C luxury landing page — single CTA, smooth-scroll to pricing, returning-customer sign-in path.
- Activation: 7-day free trial !’ resilience score within 60 seconds !’ first ritual completed within day 1.
- Retention: daily ritual habit (median streak target: 14 days), weekly trend email, periodic 'why this matters' content.
- Reactivation: lifecycle email triggered after 3-day inactivity; in-app gentle nudge on day 7.

The funnel — B2B

- Inbound: 'For Teams' link in the public landing footer; LinkedIn outbound to People & Culture leaders at high-performance organizations.
- Qualification: 30-min discovery call !’ seat-count + decision-maker confirmation.
- Pilot: 30-day paid pilot with 10–25 seats, white-glove onboarding.
- Conversion: pilot !’ annual contract at standard rate. Target conversion: 60%+.
- Expansion: seat growth within the company drives net revenue retention >120% (target).

Unit economics (founder framework)

The placeholders below are the cells Whitney should populate with actuals as they're measured. Each row is structured so an investor can see exactly which assumption drives which line in the model.

	[FILL IN — early estimate: $25–$60]
ARPU (D2C, monthly)	$9.99
Gross margin (D2C)	"e 85% (Stripe + infra + content amortization)
Median retention (target)	Month 1: 75% · Month 6: 45% · Month 12: 30%
LTV (D2C, conservative)	[FILL IN — target "e 3× CAC within 18 months]
ACV (Enterprise)	[FILL IN — early target: $15K–$60K depending on seat count]
Net revenue retention (B2B)	[FILL IN — target: >120% via seat expansion]
Payback period	[FILL IN — target: <9 months blended]

Growth levers, ranked by leverage

- 1. Founder narrative + organic press. Whitney's story is the highest-leverage acquisition channel that exists right now — and it costs nothing.
- 2. Annual plan default. Move the default selection from monthly to annual on the pricing card. Historical D2C wellness data suggests this single change can lift ARPU by 20–35%.
- 3. Apple App Store featured placement. Build #12 quality bar is high enough to pursue 'New Apps We Love' or category featuring. Direct outreach via App Store Connect after a clean review.
- 4. Referral mechanic. 'Give a month, get a month' between subscribers. Common in premium wellness; high CAC efficiency.
- 5. Enterprise pilot conversion playbook. The first three paying companies become case-study assets that unlock the next ten.

Pricing experiments (next 90 days)

- Test annual default on web checkout — measure ARPU lift.
- Test a 30-day free trial vs the current 7-day, gated by credit card up front, for one acquisition cohort.
- Test a referral incentive ('give 30 days, get 30 days') with the existing engaged-user cohort.
- Do NOT test discounting the monthly price — premium positioning is fragile and the brand promise is 'invest in your edge.'

Risk register and mitigation

Apple rejects Build #12.

Build #12 ships with friendly errors, back-navigation fixes, and a clean reviewer playbook (Part 2 of this document). Rejection risk is materially lower than a typical first submission.

High D2C CAC erodes margin.

Founder-led organic content is the cheapest, highest-leverage channel. We don't open paid budget until the organic baseline conversion rate is measured.

Enterprise pilots stall in procurement.

Concierge onboarding includes a dedicated success contact and a one-page legal addendum to short-circuit procurement back-and-forth.

Subscription churn at month 3.

The 90-day point is the documented inflection in habit-formation research. Lifecycle content interventions at day 60 and day 80 are built and tested.

Apple IAP / Stripe billing dispute.

Datadog-backed reconciliation cron runs daily; DLQ retry pipeline is live. Disputes are resolved within one billing cycle.

Closing principle

Premium wellness is a discipline business. Every pricing decision, every feature decision, every marketing decision should pass one test: does this make us look more like the brand a high-performer would actually pay for — or less? If less, we don't ship it. That's the whole strategy.

END OF DOCUMENT

Preserve Your Peak.
Prevent The Fade.
